Chapter1 Visual-inertial Preliminaries

In our main paper [IV], The term $J_r(\xi)$ is the right Jacobian of $SE(3)$ can be calculated by (1.1).

$$\begin{aligned}
 \text{Exp}(\xi^\wedge) &= \mathbf{T} = \begin{pmatrix} \mathbf{R} & \mathbf{t} \\ \mathbf{0}^T & 0 \end{pmatrix}_{4 \times 4}, \text{Exp}(\delta \xi^\wedge) = \begin{pmatrix} \delta \phi^\wedge & \delta \rho \\ \mathbf{0}^T & 0 \end{pmatrix}_{4 \times 4}, \mathbf{p} \in \mathbb{R}^3 \\
 \frac{\partial(\mathbf{T}\mathbf{p})}{\partial \delta \xi} &= \lim_{\delta \xi \rightarrow 0} \frac{\text{Exp}(\xi^\wedge) \text{Exp}(\delta \xi^\wedge) \mathbf{p} - \text{Exp}(\xi^\wedge) \mathbf{p}}{\delta \xi} \\
 &\approx \lim_{\delta \xi \rightarrow 0} \frac{\text{Exp}(\xi^\wedge) (\mathbf{I} - \delta \xi^\wedge) \mathbf{p} - \text{Exp}(\xi^\wedge) \mathbf{p}}{\delta \xi} = \lim_{\delta \xi \rightarrow 0} - \frac{\text{Exp}(\xi^\wedge) \delta \xi^\wedge \mathbf{p}}{\delta \xi} \\
 &= \lim_{\delta \xi \rightarrow 0} - \frac{\begin{pmatrix} \mathbf{R} & \mathbf{t} \\ \mathbf{0}^T & 0 \end{pmatrix} \begin{pmatrix} \delta \phi^\wedge \mathbf{p} + \delta \rho \\ 1 \end{pmatrix}}{\delta \xi} = \lim_{\delta \xi \rightarrow 0} - \frac{\begin{pmatrix} \mathbf{R} \delta \phi^\wedge \mathbf{p} + \mathbf{R} \delta \rho + \mathbf{t} \\ \mathbf{0}^T \end{pmatrix}}{\delta \xi} \\
 &= \lim_{\delta \xi \rightarrow 0} - \frac{\begin{pmatrix} -\mathbf{R} \mathbf{p}^\wedge \delta \phi + \mathbf{R} \delta \rho + \mathbf{t} \\ \mathbf{0}^T \end{pmatrix}}{\begin{pmatrix} \delta \rho \\ \delta \phi \end{pmatrix}} = \begin{pmatrix} -\mathbf{R} & \mathbf{R} \mathbf{p}^\wedge \\ \mathbf{0}^T & \mathbf{0}^T \end{pmatrix}_{4 \times 6}
 \end{aligned} \tag{1.1}$$

Homogeneous camera calibration matrices are denoted by \mathbf{K} as (1.2.1). and homogeneous 2D image coordinate point \mathbf{p} is represented by its image coordinate and inverse depth as (1.2.3) relative to its host keyframe i^L . Corresponding homogeneous 3D camera coordinate point \mathbf{p}_c is denoted as (1.2.4). Π_K are used to denote camera projection functions. The jacobian of \mathbf{I}_i^L , Π_K is denoted as (1.5)

$$\begin{aligned}
 \mathbf{K} &= \begin{pmatrix} f_x & 0 & c_x & 0 \\ 0 & f_y & c_y & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}, \mathbf{K}^{-1} = \begin{pmatrix} f_x^{-1} & 0 & -f_x^{-1} c_x & 0 \\ 0 & f_y^{-1} & -f_y^{-1} c_y & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}, \\
 \mathbf{p} &= \begin{pmatrix} u^i \\ v^i \\ 1 \\ d_p \end{pmatrix}, \mathbf{p}_c = \begin{pmatrix} x \\ y \\ z \\ 1 \end{pmatrix}, d_p = z^{-1}, \mathbf{p} = d_p \mathbf{K} \mathbf{p}_c = \Pi_K(\mathbf{p}_c) \\
 \frac{\partial(\mathbf{I}_i^L(\mathbf{p}))}{\partial \mathbf{p}} &= (g_x, g_y, 0, 0), \frac{\partial \mathbf{p}}{\partial \mathbf{p}_c} = \frac{\partial \Pi_K(\mathbf{p}_c)}{\partial \mathbf{p}_c} = \begin{pmatrix} f_x z^{-1} & 0 & -x f_x z^{-2} & 0 \\ 0 & f_y z^{-1} & -y f_y z^{-2} & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & z^{-2} & 0 \end{pmatrix}

1.1 Time-closest measurements selection strategy

Because of asynchronous but same frequency for accelerometer and gyroscope data, there will be different quantity samples of these two sensors between two consecutive keyframes. We select time-closest gyroscope measurement for one accelerometer measurement according to (Alg.1)

Algorithm 1 Time-closest measurements selection

Input: *gyro_list*, *acc_list[s]* (an element in *acc_list*)

Output: *gyro_measure* (time closest element in *gyro_list*)

```
1: function TIME_CLOSEST_SELECT(gyro_list, i)
2:    $t \leftarrow acc\_list[s].timestamp, i \leftarrow s$ 
3:   while true do
4:     if  $i \geq gyro\_list.size$  then
5:       return gyro_list.back
6:     else
7:        $t_{now} \leftarrow gyro\_list[i].timestamp$ 
8:        $t_{next} \leftarrow gyro\_list[i + 1].timestamp$ 
9:       if  $t_{now} < t$  then
10:        if  $t_{next} > t$  then
11:           $t_{front} \leftarrow abs(t_{now} - t), t_{back} \leftarrow abs(t_{next} - t)$ 
12:          return  $t_{front} > t_{back} ? gyro\_list[i + 1] : gyro\_list[i]$ 
13:        else
14:           $i = i + 1$ 
15:        end if
16:      else if  $t_{now} > t$  then
17:         $i = i - 1$ 
18:      else
19:        return gyro_list[i]
20:      end if
21:    end if
22:  end while
23: end function
```

1.2 Errors and covariance calculation pseudo code

In our main paper [Fig. 2], we can get gyroscope, accelerometer data lists whose size is m, n . We have 8 error items to define:

$\Delta\bar{\mathbf{R}}_{ij}, \frac{\partial\Delta\bar{\mathbf{R}}_{ij}}{\partial\mathbf{b}^g}, \frac{\partial\Delta\bar{\mathbf{v}}_{ij}}{\partial\mathbf{b}^a}, \frac{\partial\Delta\bar{\mathbf{p}}_{ij}}{\partial\mathbf{b}^a}$ are pure rotation values and aren't related to accelerometer data.

$\Delta\bar{\mathbf{v}}_{ij}, \frac{\partial\Delta\bar{\mathbf{v}}_{ij}}{\partial\mathbf{b}^g}, \Delta\bar{\mathbf{p}}_{ij}, \frac{\partial\Delta\bar{\mathbf{p}}_{ij}}{\partial\mathbf{b}^g}$ are rotation “plus” translation values and are related to both gyroscope and accelerometer data.

In order to calculate conveniently, we introduce a *rotate_list* to store all pure rotation values. All error items can see in (Alg.2)

Algorithm 2 On-Manifold Preintegration for IMU

Output: $(\Delta \bar{\mathbf{R}}_{ij}, \frac{\partial \Delta \bar{\mathbf{R}}_{ij}}{\partial \mathbf{b}^g}, \frac{\partial \Delta \bar{\mathbf{v}}_{ij}}{\partial \mathbf{b}^a}, \frac{\partial \Delta \bar{\mathbf{p}}_{ij}}{\partial \mathbf{b}^a}), (\Delta \bar{\mathbf{v}}_{ij}, \frac{\partial \Delta \bar{\mathbf{v}}_{ij}}{\partial \mathbf{b}^g}, \Delta \bar{\mathbf{p}}_{ij}, \frac{\partial \Delta \bar{\mathbf{p}}_{ij}}{\partial \mathbf{b}^g}), \Sigma_{ij}$

Chapter3 Photo Error Factors

3.1 Construction residual errors

Dynamic multi-view stereo residuals $E_{ij}^{\mathbf{p}}$ are defined as

$$E_{ij}^{\mathbf{p}} = w_{\mathbf{p}} \|(r_{\mathbf{p}}^d)_{ij}\|_{\gamma}, \quad (r_{\mathbf{p}}^d)_{ij} := I_j^L(\mathbf{p}') - b_j^L - \frac{e^{a_j^L}}{e^{a_i^L}}(I_i^L(\mathbf{p}) - b_i^L) \quad (2.2)$$

γ is Huber norm. a_i^L, b_i^L is affine brightness parameters to frame iL . $w_{\mathbf{p}}$ is a gradient-dependent weighting parameters, \mathbf{p} in frame iL projected to i_j^L is \mathbf{p}' as:

$$w_{\mathbf{p}} := \frac{c^2}{c^2 + \|\nabla I_i(\mathbf{p})\|_2^2}, \quad \mathbf{p}' = d_{\mathbf{p}}^{jL} \mathbf{K}(\mathbf{T}_j \mathbf{T}_i^{-1} ((d_{\mathbf{p}}^{iL})^{-1} \mathbf{K}^{-1} \mathbf{p})) \quad (2.3)$$

Static one-view stereo residuals $E_{is}^{\mathbf{p}}$ are modified to

$$E_{is}^{\mathbf{p}} = w_{\mathbf{p}} \|r_{\mathbf{p}}^s\|_{\gamma}, \quad r_{\mathbf{p}}^s := I_i^R(\mathbf{p}') - b_i^R - \frac{e^{a_i^R}}{e^{a_i^L}}(I_i^L(\mathbf{p}) - b_i^L) \quad (2.2)$$

Hostframe of \mathbf{p} is i_i^L . a_i^R, b_i^R is affine brightness parameters to frame iR . \mathbf{p} in frame i_i^L projected to i_i^R is \mathbf{p}' as:

$$\mathbf{p}' = d_{\mathbf{p}}^{iR} \mathbf{K}(\mathbf{T}_{RL}((d_{\mathbf{p}}^{iL})^{-1} \mathbf{K}^{-1} \mathbf{p})) \quad (2.2)$$

Total residuals

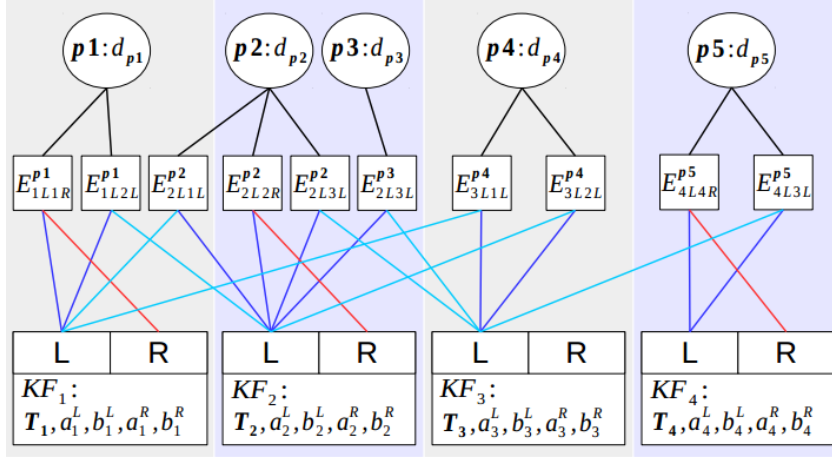

$$E(\delta) = \sum_{i \in \mathcal{F}} \sum_{\mathbf{p} \in \mathcal{P}_i} \left(\sum_{j \in \text{obs}^t(\mathbf{p})} E_{ij}^{\mathbf{p}} + \lambda E_{is}^{\mathbf{p}} \right) \quad (2.2)$$

$$\delta = \begin{pmatrix} (\xi_1^T, \dots, \xi_{N_f}^T)^T \\ (d_{\mathbf{p}_1}, \dots, d_{\mathbf{p}_{N_p}})^T \\ (a_1^L, a_1^R, b_1^L, b_1^R)^T \\ \vdots \\ (a_{N_f}^L, a_{N_f}^R, b_{N_f}^L, b_{N_f}^R)^T \\ (f_x, f_y, c_x, c_y)^T \end{pmatrix} \in \mathbb{R}^{10N_f + N_p + 4}, \xi_i = (\ln \mathbf{T}_i)^V \in \mathbb{R}^6 \quad (2.1)$$

To balance the relative weights of temporal multi-view and static stereo, we introduce a coupling factor λ to weight the constraints from static stereo differently. \mathcal{P}_i is a set of all image point host by frame iL . $\text{obs}^t(\mathbf{p})$ are the observations of \mathbf{p} from temporal multi-view stereo. If there are N_p image point and N_f keyframes in \mathcal{F} , optimization variable δ is

In this example, there are 7 dynamic residuals and 3 static residuals, Factor graph of the residuals function is

Total residuals is

Iteration δ^* can be calculated by

1.3.2 Static Parameter

Firstly, For a stereo frame i : inverse depth $d_{\mathbf{p}}^{iL} = d_{\mathbf{p}}^{iR}$, a left frame iL pixel \mathbf{p} is projected to right frame iR with \mathbf{p}' :

$$\begin{aligned}
 \mathbf{p} &= \begin{pmatrix} u^i \\ v^i \\ 1 \\ d_{\mathbf{p}}^{iL} \end{pmatrix}, \mathbf{p}_w = \begin{pmatrix} x \\ y \\ z \\ 1 \end{pmatrix}, d_{\mathbf{p}}^{iL} = z^{-1}, \mathbf{p}_w = (d_{\mathbf{p}}^{iL})^{-1} \mathbf{K}^{-1} \mathbf{p} \\
 &= \begin{pmatrix} f_x^{-1} (d_{\mathbf{p}}^{iL})^{-1} (u^i - c_x) \\ f_y^{-1} (d_{\mathbf{p}}^{iL})^{-1} (v^i - c_y) \\ (d_{\mathbf{p}}^{iL})^{-1} \\ 1 \end{pmatrix}, \mathbf{T}_{RL} = \begin{pmatrix} 1 & 0 & 0 & t_1 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \\
 \mathbf{p}' &= d_{\mathbf{p}}^{iR} \mathbf{K} (\mathbf{T}_{RL} \mathbf{p}_w) \\
 &= d_{\mathbf{p}}^{iL} \begin{pmatrix} f_x & 0 & c_x & 0 \\ 0 & f_y & c_y & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} f_x^{-1} (d_{\mathbf{p}}^{iL})^{-1} (u^i - c_x) + t_1 \\ f_y^{-1} (d_{\mathbf{p}}^{iL})^{-1} (v^i - c_y) \\ (d_{\mathbf{p}}^{iL})^{-1} \\ 1 \end{pmatrix} = \begin{pmatrix} u^i + t_1 f_x d_{\mathbf{p}}^{iL} \\ v^i \\ 1 \\ d_{\mathbf{p}}^{iL} \end{pmatrix} \quad (1) \\
 \frac{\partial r_{\mathbf{p}}^s}{\partial d_{\mathbf{p}}^{iL}} &= \frac{\partial (I_i^R(\mathbf{p}')) - \frac{e^{a_i^R}}{e^{a_i^L}} (I_i^L(\mathbf{p}))}{\partial d_{\mathbf{p}}^{iL}} = \left(\frac{\partial (I_i^R(\mathbf{p}'))}{\partial \mathbf{p}'} - \frac{e^{a_i^R}}{e^{a_i^L}} \frac{\partial (I_i^L(\mathbf{p}))}{\partial \mathbf{p}'} \right) \frac{\partial \mathbf{p}'}{\partial d_{\mathbf{p}}^{iL}} \\
 &= [(g_x^{iR}, g_y^{iR}, 0, 0) - \mathbf{0}^T] \begin{pmatrix} t_1 f_x \\ 0 \\ 0 \\ 1 \end{pmatrix} = g_x^{iR} t_1 f_x
 \end{aligned}$$

Secondly, according to:

$$r_{\mathbf{p}}^s := I_i^R(\mathbf{p}') - b_i^R - \frac{e^{a_i^R}}{e^{a_i^L}} (I_i^L(\mathbf{p}) - b_i^L) \quad (2.2)$$

We have:

$$\begin{aligned}
 \frac{\partial (r_{\mathbf{p}}^s)_{ij}}{\partial a_i} &= \frac{e^{a_j^L}}{e^{a_i^L}} (I_i^L(\mathbf{p}) - b_i^L), \frac{\partial (r_{\mathbf{p}}^s)_{ij}}{\partial a_j} = -\frac{e^{a_j^L}}{e^{a_i^L}} (I_i^L(\mathbf{p}) - b_i^L) \\
